

Code by Kevin releases QuickWho 2.1

Published on 01/25/10

Code by Kevin has released QuickWho 2.1, a OS X GUI to help users look up Internet domain registrations. QuickWho provides a handy graphical interface to the Unix "whois" command-line utility on OS X. It is used to find out more about who registered a particular Internet domain name. Are you curious about who owns a particular domain name? Do you want to contact them, or gather more information about them? QuickWho can help you with these tasks.

Cincinnati, Ohio - Code by Kevin has released version 2.1 of QuickWho, an OS X GUI to help users look up Internet domain registrations. QuickWho provides a handy graphical interface to the Unix "whois" command-line utility on OS X, which is used to find out more about who registered a particular Internet domain name. Are you curious about who owns a particular domain name? Do you want to contact them, or gather more information about them? QuickWho can help you with these tasks.

QuickWho compared to other "whois" tools:

- * Simpler than using the command-line. Type, hit return, and view the data
- * Faster than other GUI tools: tree view makes it easy to query multiple servers with mouse or keyboard clicks
- * Less cumbersome than using an Internet-based whois tool. No need to load web page into browser
- * Pleasant-to-use, Mac-native interface

Among the new features in QuickWho 2.1:

- * Now a fully 64-bit application built on the Cocoa frameworks
- * Now includes support for AppleScript and Services
- * Main window behavior now fully conforms to Mac UI standards: window hides when closed or via Command-W, and minimizes via Command-M
- * Bug fixes and optimizations for faster output
- * Assorted user interface improvements

Pricing and Availability:

QuickWho is shareware. The download is a 30-day demo; you can purchase a license to use the program past the 30-day trial period. Mac OS X 10.5 is the minimum supported platform. QuickWho is a universal binary and licenses cost \$12.95 (USD).
