

## Smart iWeb Publishing with iWebFlinger

Published on 02/21/07

iWebFlinger allows an iWeb user to choose a site to upload, an ftp server to upload to, and to optionally insert a favicon and your own html code. Best of all, your ftp passwords are secured via OS X's Keychain.

iWebFlinger allows an iWeb user to choose a site to upload, an ftp server to upload to, and to optionally insert a favicon and your own html code. Best of all, your ftp passwords are secured via OS X's Keychain.

Whats more, once you set up the source folder (which is the folder you publish your site to), and ftp server, the iWebFlinger daemon automatically checks for changes to the source folder. Then it finds only those files which have actually changed (not just their creation/modification times since iWeb changes them all), and uploads them.
