

Code by Kevin releases PacketStream 2.0, network monitor

Published on 02/25/07

Code by Kevin has released version 2.0 of PacketStream, a network monitoring program for Mac OS X. PacketStream provides point-and-click activation of the Mac's built-in network monitoring program, which is usually available only from the command line. By clicking a few buttons, users can monitor data as it streams over a network--especially useful for checking web traffic, network bottlenecks, or even suspicious network activity.

FOR IMMEDIATE RELEASE

Code by Kevin has released version 2.0 of PacketStream, a network monitoring program for Mac OS X.

PacketStream provides point-and-click activation of the Mac's built-in network monitoring program, which is usually available only from the command line. By clicking a few buttons, users can monitor data as it streams over a network--especially useful for checking web traffic, network bottlenecks, or even suspicious network activity.

Version 2.0 features the following improvements:

- * New icons for greater ease-of-use.
- * Search the data display for specific terms.
- * Configure scanner to monitor specific specific network ports.

PacketStream is shareware; licenses are available for \$20.00 and a 30-day demo is available. PacketStream is a universal binary and requires Mac OS X 10.4.
