

Mac utility helps photographers correct incorrectly set camera clocks

Published on 03/22/07

A Better Finder Attributes is a great help for digital camera owners who wish to compensate for incorrectly set camera clocks or for timezone differences. It allows the Exchangeable Image File Format (EXIF) date and time information embedded in digital photo files to be adjusted. This information is used by modern photo management and post-production software to organize image data. In addition, A Better Finder Attributes allows a large variety of other file meta data to be manipulated.

FOR IMMEDIATE RELEASE

publicspace.net is pleased to announce version 4.4.5 of its "A Better Finder Attributes" file utility.

A Better Finder Attributes has long been known to post-production and digital media producers for its ability to change Finder attributes, such as creation and modification dates.

The recent 4.4 release brought it to a larger audience of digital photography amateurs and professionals alike by adding the ability to batch adjust the Exchangeable Image File (EXIF) time and date that JPEG pictures were shot to compensate for timezone errors or incorrectly set camera clocks.

The latest 4.4.5 version adds improved date and time pickers and correct a problem affecting international users.

The price of A Better Finder ATTRIBUTES is reduced from \$19.95 to \$14.95 for a single user license. Site licensing is available.
