Vancouver, BC/Canada - Kenaxis Creative has announced the release of Kenaxis 3, a major upgrade to their sound manipulation software. Kenaxis 3 transforms your computer into a powerful instrument of real-time musical expression. Designed for users who want to create truly innovative music and unexpected sounds, it works with audio that is: prerecorded and saved to your hard disk, synthesized on the spot, or captured on the fly from an external source.

Users can drag and drop sound files or record live audio feeds into six loop modules or a granular synth module. You can easily control the pitch, loop points, and volume to create a variety of sonic textures. An adjustable crossfade feature allows for click-free looping and the creation of loop drones. A unique negative crossfade feature adds space between your loops, lowering the density and allowing the creation of polyrhythmic interactions.

Created by a musician for musicians, Kenaxis 3 has found audiences worldwide with over nine years' continuous programming, development, and testing. Designed from the ground up to be an interactive instrument, Kenaxis 3 is ideal for live performance, composition, and experimentation. Whether you need to interact in real-time with other musicians or record experiments and composition that can be edited later, Kenaxis 3 is that rare piece of inspired software that can capture the sounds at the edge of your imagination - and beyond.
