

Colovo Releases Timepost 1.2

Published on 04/18/07

Timepost is a project timer that integrates with popular internet time sheet services. Timepost simplifies time tracking by automatically posting accurate project times to the internet. This fast and reliable application saves time, money, and resources by offering accurate timetracking for Basecamp, Harvest, and Tick.

Today, Colovo released Timepost 1.2, a project timer that integrates with popular internet time sheet services. Timepost simplifies time tracking by automatically posting accurate project times to the internet. This fast and reliable application saves time, money, and resources by offering accurate timetracking for Basecamp, Harvest, and Tick.

Timepost Works While you Do

Timepost is amazing software when it comes to getting things done. We've set out to improve web-based time trackers by creating a Mac-friendly timer interface. Timepost automatically downloads projects and to-dos from the internet, so you won't need to re-enter any information.

Timepost automatically tracks your project times without getting in the way. In fact, you don't even need to have it running to time yourself. You can create and run an unlimited amount of timers and forget about them until you're done. Once you're ready to post your time, just click the "Log Time" button and it's recorded.

Not only is Timepost a simple project timer, but a powerful extension to your existing web service. Timepost remembers login details and allows you to reuse timers. To make task navigation easy, we've even included a function to ignore tasks unassigned to your account.

New Features in Version 1.2

- * Sound notification for posting times
- * Automatic formatting for service addresses
- * Rounding intervals can now be customized
- * Times can be automatically rounded when posting

Bug Fixes:

- * Associated projects & to-dos are now remembered
- * Timer name and description can now be set while running
- * Error messages are now easier to read
- * Timepost has been rewritten to use less CPU

Availability and Pricing

Timepost requires Mac OS X 10.4 (Tiger) or later, and an account on Basecamp, Harvest, or Tick. At the website, a trial version is available which allows for three time logs.

Timepost sells for US\$39.00 per computer license, and US\$179 for a business license (6 computers). Purchasing a license includes free Timepost 1.x updates and email support.
