

Chromatic Bytes releases Shades 1.1

Published on 05/16/07

Chromatic Bytes released version 1.1 of Shades, its addition to the Apple OS X Color Picker. This version adds support for obtaining the HTML hex string of a color. It also fixes a problem that prevented using Shades with Adobe Lightroom.

FOR IMMEDIATE RELEASE

Chromatic Bytes released version 1.1 of Shades, its addition to the Apple OS X color picker. Shades helps users select a color by showing a grid of closely related colors.

Version 1.1 adds support for hex strings for html colors.

- Holding the mouse over a color chip gives a tooltip that shows the hex string for the color as well as its RGB and HSB values.

- Option clicking on a color chip loads the hex string for that color into the clipboard so that it can be pasted into an HTML editor.

Version 1.1 also fixes a problem that would cause Adobe Lightroom to hang when Shades is used with Lightroom.

Shades 1.1 is a free update for current users.
