

Calf Trail releases Geotagalog 1.0 - GPS logger for iPhoto's Places

Published on 03/26/09

Calf Trail Software, LLC today announced Geotagalog 1.0, their software utility for geotagging digital photos using a GPS tracklog. Geotagalog automatically combines digital photos with location data from a GPS tracklog, showing a live preview as the user adjusts camera time settings for better alignment. Geotagalog adds user-friendly support for iPhoto's Places feature to any digital camera. Users may download a demo version which limits the number of photos imported.

Sunnyside, Washington, USA - Calf Trail Software, LLC has announced that version 1.0 of their Geotagalog software utility is now available. Geotagalog automatically combines digital photos with location data from a GPS tracklog, showing a live preview as the user adjusts camera time settings for better alignment. Geotagalog adds user-friendly support for iPhoto's Places feature to any digital camera. Users may download a demo version which limits the number of photos imported. The full version costs \$19.95 and is available immediately.

Geotagalog:

- * Opens a standard GPX tracklog file and displays it on a simple map
- * Geotags photos from a connected digital camera or a folder
- * Shows live preview of photo locations
- * Allows user to adjust camera time zone and adjust for camera clock error
- * Imports photos into iPhoto with the click of a button
- * Allows photos from any digital camera to appear in iPhoto '09 Places as if they came from a GPS-enabled camera

Beta testers described Geotagalog (then known as Tagalog) as easier to use than previously available options. Geotagalog joins Calf Trail's recently released Mercatalog, a map-based photo organizer, in rethinking photo geotagging from the ground up, using drag-and-drop interactions and visual feedback. Company co-founder Nathan Vander Wilt writes, "Geotagging should feel more like a treasure map than a spreadsheet. We've got big goals, and are proud of what we are able to offer in these first products."

Details/requirements:

- * 11.8 MB download
- * Requires Mac OS X Version 10.5 Leopard
- * Universal Binary works on PowerPC and Intel
