

## Rainer Brockerhoff updates Klicko 1.1.1; Blocks Click-Through, Maximizes

Published on 05/11/09

Rainer Brockerhoff has announced version 1.1.1 of Klicko, a small freeware utility that blocks undesired click-through in application windows. Klicko is a System Preferences panel written in Cocoa. It doesn't hack the system, other applications, inject code or do anything magic. Now you must first click anywhere inside a background window to bring it to the front. Klicko also has two other convenient functions: window maximizing and bringing all windows of some application to the front at once.

Belo Horizonte, Brazil - Rainer Brockerhoff has announced version 1.1.1 of Klicko, a small freeware utility that blocks undesired click-through in application windows. In the Classic days, if you wanted to use a window that wasn't frontmost, you could click anywhere on it to bring it to the front. Mac OS X introduced a feature called "click-through" where certain controls, like the "traffic-light" buttons in the window title, would work even for background windows. Applications can also make other controls, or even the entire window, work with click-through.

Now you must first click anywhere inside a background window to bring it to the front. Klicko also has two other convenient functions: window maximizing and bringing all windows of some application to the front at once.

New in this version:

- \* Some applications reported to be incompatible are now added to the exclusion list during installation.
- \* The updating process is now more reliable and uses less system resources.
- \* Several bugs and edge cases have been fixed.

Features:

- \* Klicko can be instructed to not act on any of a list of applications, or
- \* Klicko can act only on specific applications in a list.
- \* Klicko can make a window's Zoom button maximize the window to the full screen.
- \* Bring all windows of an application forward by control-option-command-clicking on any of them; this also lets you bring all Finder windows forward by control-option-command-clicking on the desktop.
- \* Klicko will momentarily let through any clicks with a modifier key.

Minimum Requirements:

- \* Mac OS X Version 10.5 Leopard
- \* Universal Binary for PowerPC and Intel

If you, too, think click-through is inconsistent and annoying, Klicko will be useful. Klicko is a System Preferences panel written in Cocoa. It doesn't hack the system, other applications, inject code or do anything magic.
