

Easily Import Event Lists From Text Into Apple's Calendar

Published on 04/22/14

Independent software developer, John Maisey introduces Multi Event Filter 1.0 for OS X. Multi Event Filter offers a new, quick and flexible way to create events in Apple's Calendar application from lists of plain text. Easily process events in text from websites, emails, spreadsheets and anywhere else events are listed. The user can select, filter and modify each event's information before adding to their calendar of choice in Apple's Calendar application.

London, United Kingdom - Independent software developer, John Maisey is proud to announce the initial release of Multi Event Filter 1.0 on the Mac App Store. Multi Event Filter is a new, quick and flexible way to create events in Apple's Calendar application from lists of plain text. Process events in text from websites, emails, spreadsheets and anywhere else events are listed. The user can select, filter and modify each event's information before adding to their calendar of choice in Apple's Calendar application.

Multi Event Filter can be used as a service from other applications, by pasting text into it and even by entering text directly into Multi Event Filter itself. Dates found in the text are highlighted and the user is prompted with options of the event time, duration, title and which of their calendars the event should be added to.

Multi Event Filter uses and extends Apple's Data Detectors giving access to event information from applications which do not support them directly, allows each individual event to be placed in the calendar the user chooses, and it also provides comprehensive keyboard shortcuts to allow quick edit and entry of multiple events.

System Requirements:

- * OS X 10.8 or later
- * 0.6 MB

Pricing and Availability:

Multi Event Filter 1.0 is \$2.99 USD (or equivalent amount in other currencies) and available worldwide through the Mac App Store in the Productivity category.
