

## 24U announces Cryptor for iPhone, iPad, and iPod touch

Published on 03/30/15

24U Software introduces Cryptor 1.0, a new mobile application for iOS devices. Cryptor can encrypt or decrypt the current contents of the user's clipboard as well as data provided to it by other applications through an URI or HTTP request. This makes the app a great companion for FileMaker Go and others. Users can easily encrypt or decrypt via the clipboard to protect any text or image manually, with multiple encryption keys that allow for sending encrypted data to someone else and more.

Zvole, Czech Republic - 24U Software announces the immediate availability of Cryptor, a new mobile application for iPhone, iPad, and iPod touch. Cryptor can encrypt or decrypt the current contents of the user's clipboard as well as data provided to it by other applications through an URI or HTTP request, making it, besides others, a great companion for FileMaker(R) Go.

### Main features:

- \* Encrypt/decrypt clipboard to protect any text or image manually
- \* Multiple encryption keys allow for sending encrypted data to someone else
- \* URI scheme lets other apps (such as FileMaker Go) easily use Cryptor as a service
- \* Built-in HTTP server can provide the service from background

### How Cryptor works:

Cryptor lets the user create multiple encryption keys and then use them to encrypt and decrypt data. User can choose which key will be used for encryption, and Cryptor automatically identifies the correct key to use for decryption as long as it is installed.

Cryptor responds to URI queries from other apps to let them use it as a service. Launching a properly constructed URI from a different app will switch over to Cryptor, encrypt or decrypt data, and switch back to the requesting app.

Cryptor also includes a built-in HTTP server to allow other apps on the same device to repeatedly use its services without constantly switching between the client app and Cryptor, which would be very inconvenient for the user. Due to the restrictions for iOS, the HTTP server can be started by a single URI request and remains active for a limited time after Cryptor gets switched to background.

Cryptor was primarily designed to be a great companion for FileMaker Go, which does not have its own native functions for strong encryption on demand, but it can be well used as a service by other apps as well.

### Device Requirements:

- \* iPhone, iPad and iPod touch
- \* Requires iOS 7.0 or later
- \* Optimized for iPhone 5
- \* 7.3 MB

### Pricing and Availability:

24U Cryptor 1.0 is \$1.99 USD (offers optional features via in-app purchase) and available worldwide exclusively through the App Store in the Utilities category.
