

Sarsoft releases Baby Monitor & Alarm 1.0 for iPhone

Published on 10/01/09

Czech based Sarsoft today is proud to introduce Baby Monitor & Alarm 1.0, their new application for iPhone devices. Baby Monitor & Alarm brings new and innovative functions to babysitting. When it detects a noise in the child's room, parents are immediately notified. Baby Monitor & Alarm offers the ability to record your child's voice. Whether mum's voice or your child's favorite song, this voice can be replayed to your child when he/she starts crying.

Praha, Czech Republic - Sarsoft today is pleased to announce the launch of its new product - Baby Monitor & Alarm for iPhone. "We are continuing with the development of innovative applications for the iPhone, and Baby Monitor & Alarm is another ingenious invention", says Jindrich Sarson, director of Sarsoft. Baby Monitor & Alarm brings new and innovative functions to Baby Monitor applications.

Every Baby Monitor product can monitor children who sleep in their bedroom and their parents are notified immediately if there is any noise in the children's room. But Baby Monitor & Alarm for iPhone goes even further. One of our unique features is "Mum's voice".

"Everybody knows, that mum's voice is very soothing and comforting to a child", says Sarson. Therefore Sarsoft implemented functionality to record any voice (it doesn't matter if it's mum's voice or your child's favorite song), and this voice can be replayed to your child when he/she starts crying. This has proven to be very effective.

"We have feedback from our users performing beta-testing. According to our users, it works perfectly, and in some cases, the child even goes back to sleep", adds Sarson, who is also a father of 2 young children. This functionality is optional and it depends on parents, if they want to use it.

Another functionality that got approval from its users is the application's ability to record your child's voice. The application simply records all voice activity in the child's room. It doesn't matter, if the application is set to alarm or if it's only in monitoring mode. By using this function, parents can easily check, if their child has coughs or if they have bad dreams. All activity is displayed in the Activity log found in the application. This makes it possible for the parents to check their child's sleeping patterns. They just need to compare the Activity log for several days.
