

Command-Tab Plus for OS X - New Keyboard-Centric Application Switcher

Published on 11/16/16

Note-Ify Apps today introduces Command-Tab Plus 1.0 for macOS. Command-Tab Plus is a great alternative for Mac's built-in Command-Tab app switcher. When working with a lot of apps that run simultaneously, switching between them becomes a problem, because it is often time consuming. Command-Tab Plus is designed to let you switch between apps in a faster and more convenient way. It helps you to get rid of the chaos that happens when there are too many apps running at the same time.

Kyev, Ukraine - Note-Ify Apps today is pleased to announce the release of Command-Tab Plus 1.0 for macOS. Command-Tab Plus is a great alternative for Mac's built-in Command-Tab app switcher. When working with a lot of apps that run simultaneously, switching between them becomes a problem, because it is often time-consuming. Command-Tab Plus is designed to let you switch between apps in a faster and more convenient way. It helps you to get rid of the chaos that happens when there are too many apps running at the same time.

* Quick switch between applications:

Use icon numbers to quickly select and switch between apps. To do that, use a shortcut to open the switch window and simply press the app number on the keyboard. This will significantly save you time.

* Isolated workspaces:

When using Command-Tab Plus, it displays only the icons of the apps running on the current display or space. Thus, it isolates the apps in one space, and the apps in other spaces. Of course, you can disable this function in the app's settings.

* Hide the apps you're not using:

By default, Command-tab Plus hides the icons of all inactive (hidden) apps. This function allows you to quickly switch between the apps you are using at the moment, so you will not be distracted by the other apps. The Command-Tab Plus settings let you enable the hidden apps to be shown, thus, the inactive apps icons will be marked (semitransparent) and displayed at the end of the list.

* Configure the shortcuts:

The Command-Tab Plus settings allow setting up a keyboard shortcut, press it and you will see a switcher window. Besides, you can configure Command-Tab Plus to be shown up instead of a "regular" window to switch between applications. Or you can setup another shortcut to use simultaneously with the regular app switcher. Command-Tab Plus works similarly to the "regular" switcher. It helps to organize the work with spaces and external displays in a better and more rational way.

* Customizing the appearance:

The Command-Tab Plus settings allow setting a theme colour, a highlighted element colour, a window frame colour and icon sizes. Basically, you can customize it.

System Requirements:

* macOS X 10.7 or later

Pricing and Availability:

Command-Tab Plus is free to download and install and is fully-functional for 7 days. After 7 days, it remains fully-functional but will occasionally ask users to register. Users can take advantage of an introductory registration price of only \$7.95 (USD), which is good through November of 2016. Upon registration, Command-Tab Plus will no longer ask users to register.
